

Forecast reconciliation

4. Temporal & cross-temporal forecast reconciliation

Rob J Hyndman

MONASH University

robjhyndman.com/fr2023

Notation reminder

Every collection of time series with linear constraints can be written as

$$\mathbf{y}_t = \mathbf{S}\mathbf{b}_t$$

- \mathbf{y}_t = vector of all series at time t
- $y_{\text{Total},t}$ = aggregate of all series at time t .
- $y_{X,t}$ = value of series X at time t .
- \mathbf{b}_t = vector of most disaggregated series at time t
- \mathbf{S} = “summing matrix” containing the linear constraints.

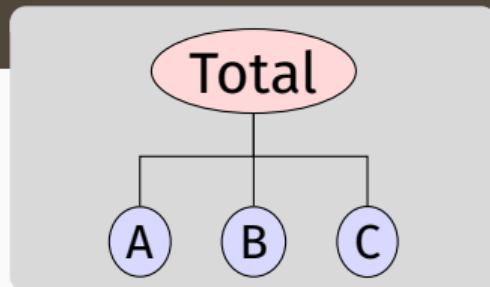

$$\begin{aligned} \mathbf{y}_t &= \begin{pmatrix} y_{\text{Total},t} \\ y_{A,t} \\ y_{B,t} \\ y_{C,t} \end{pmatrix} \\ &= \underbrace{\begin{pmatrix} 1 & 1 & 1 \\ 1 & 0 & 0 \\ 0 & 1 & 0 \\ 0 & 0 & 1 \end{pmatrix}}_S \underbrace{\begin{pmatrix} y_{A,t} \\ y_{B,t} \\ y_{C,t} \end{pmatrix}}_{\mathbf{b}_t} \end{aligned}$$

Notation reminder

Every collection of time series with linear constraints can be written as

$$\mathbf{y}_t = \mathbf{S}\mathbf{b}_t$$

- \mathbf{y}_t = vector of all series at time t
- $y_{\text{Total},t}$ = aggregate of all series at time t .
- $y_{X,t}$ = value of series X at time t .
- \mathbf{b}_t = vector of most disaggregated series at time t
- \mathbf{S} = “summing matrix” containing the linear constraints.

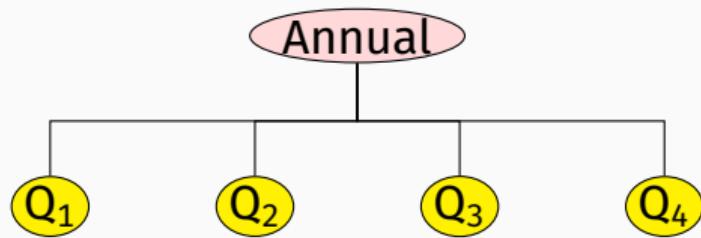

- Base forecasts: $\hat{\mathbf{y}}_{T+h|T}$
- Reconciled forecasts:
 $\tilde{\mathbf{y}}_{T+h|T} = \mathbf{S}\mathbf{G}\hat{\mathbf{y}}_{T+h|T}$
- MinT:
 $\mathbf{G} = (\mathbf{S}'\mathbf{W}_h^{-1}\mathbf{S})^{-1}\mathbf{S}'\mathbf{W}_h^{-1}$
where \mathbf{W}_h is covariance matrix of base forecast errors.

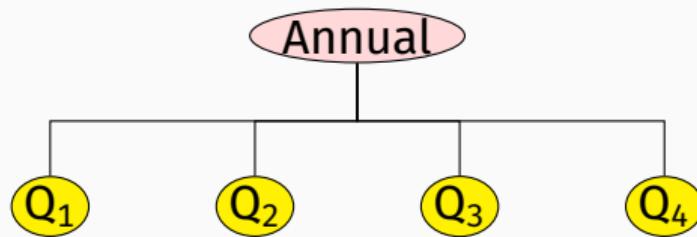

Outline

- 1 Temporal reconciliation
- 2 Temporal reconciliation: thief package
- 3 Temporal reconciliation: Examples
- 4 Cross-temporal forecast reconciliation
- 5 Cross-temporal probabilistic forecast reconciliation
- 6 Cross-temporal probabilistic reconciliation: Examples

Temporal reconciliation: quarterly data

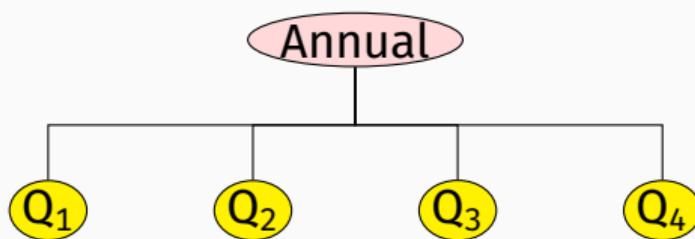

Temporal reconciliation: quarterly data

- Forecast series at each available frequency.
- Optimally combine forecasts within the same year.

Temporal reconciliation: quarterly data

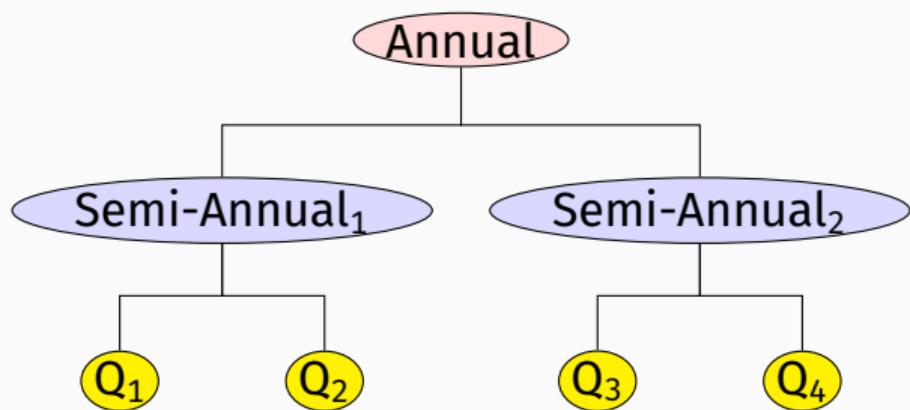

$$\mathbf{y}_\tau = \begin{bmatrix} x_\tau^{[4]} \\ x_{\tau,1}^{[1]} \\ x_{\tau,2}^{[1]} \\ x_{\tau,3}^{[1]} \\ x_{\tau,4}^{[1]} \end{bmatrix} \quad \mathbf{S} = \begin{bmatrix} 1 & 1 & 1 & 1 \\ 1 & 0 & 0 & 0 \\ 0 & 1 & 0 & 0 \\ 0 & 0 & 1 & 0 \\ 0 & 0 & 0 & 1 \end{bmatrix}$$

- Forecast series at each available frequency.
- Optimally combine forecasts within the same year.

τ = index of largest temporal aggregation level.

Temporal reconciliation: quarterly data

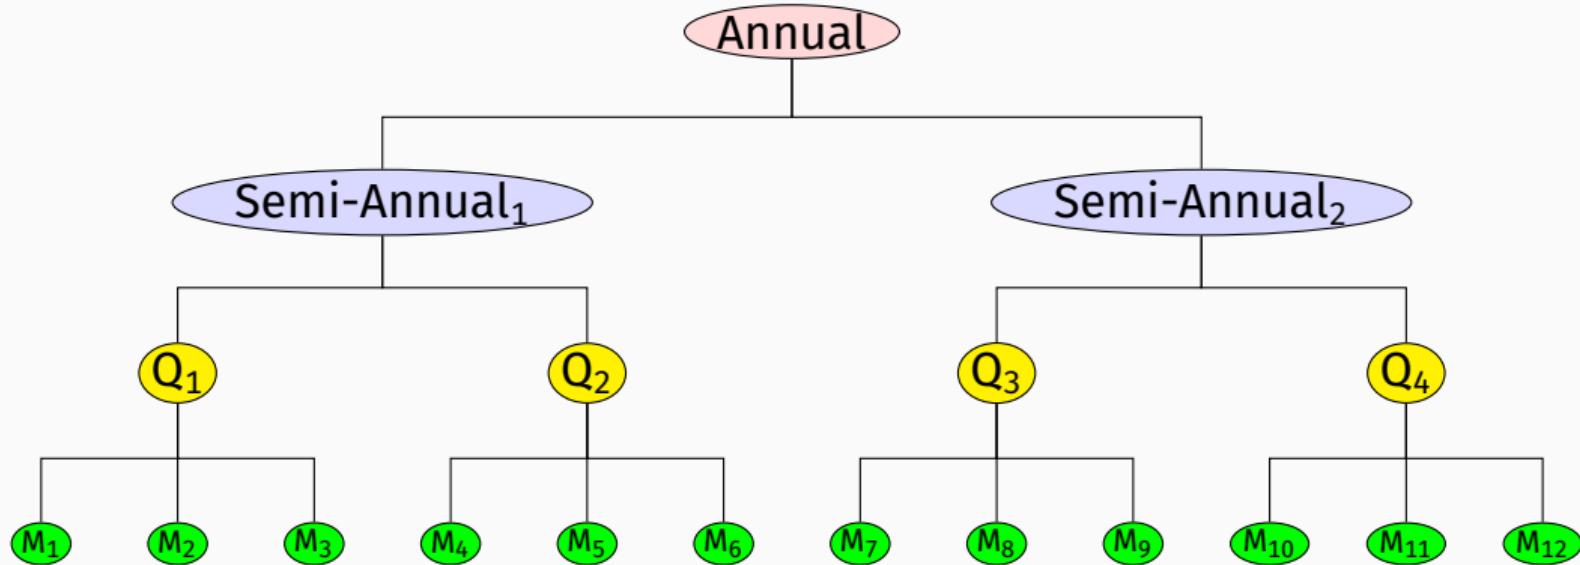

- Forecast series at each available frequency.
- Optimally combine forecasts within the same year.

$$\mathbf{y}_\tau = \begin{bmatrix} x_\tau^{[4]} \\ x_{\tau,1}^{[2]} \\ x_{\tau,2}^{[2]} \\ x_{\tau,1}^{[1]} \\ x_{\tau,2}^{[1]} \\ x_{\tau,3}^{[1]} \\ x_{\tau,4}^{[1]} \end{bmatrix}$$
$$\mathbf{S} = \begin{bmatrix} 1 & 1 & 1 & 1 \\ 1 & 1 & 0 & 0 \\ 0 & 0 & 1 & 1 \\ 1 & 0 & 0 & 0 \\ 0 & 1 & 0 & 0 \\ 0 & 0 & 1 & 0 \\ 0 & 0 & 0 & 1 \end{bmatrix}$$

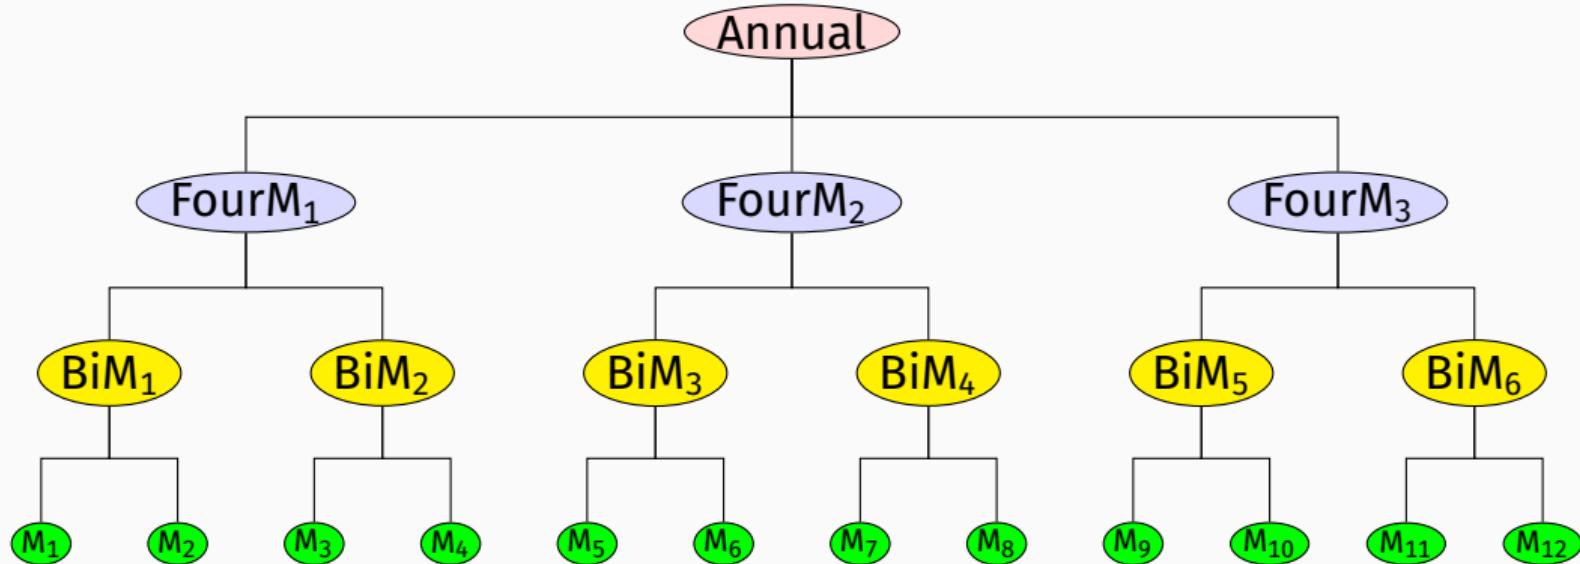

τ = index of largest temporal aggregation level.

Temporal reconciliation: monthly data

- Forecast series at each available frequency.
- Optimally combine forecasts within the same year.

Temporal reconciliation: monthly data

- Forecast series at each available frequency.
- Optimally combine forecasts within the same year.

Temporal reconciliation: monthly data

$$\mathbf{y}_\tau = \begin{bmatrix} \mathbf{x}_\tau^{[12]} \\ \mathbf{x}_\tau^{[6]} \\ \mathbf{x}_\tau^{[4]} \\ \mathbf{x}_\tau^{[3]} \\ \mathbf{x}_\tau^{[2]} \\ \mathbf{x}_\tau^{[1]} \end{bmatrix}$$

$$\mathbf{S} = \begin{bmatrix} 1 & 1 & 1 & 1 & 1 & 1 & 1 & 1 & 1 & 1 & 1 & 1 \\ 1 & 1 & 1 & 1 & 1 & 1 & 0 & 0 & 0 & 0 & 0 & 0 \\ 0 & 0 & 0 & 0 & 0 & 0 & 1 & 1 & 1 & 1 & 1 & 1 \\ 1 & 1 & 1 & 1 & 0 & 0 & 0 & 0 & 0 & 0 & 0 & 0 \\ 0 & 0 & 0 & 0 & 1 & 1 & 1 & 1 & 0 & 0 & 0 & 0 \\ 0 & 0 & 0 & 0 & 0 & 0 & 0 & 0 & 1 & 1 & 1 & 1 \\ 1 & 1 & 1 & 0 & 0 & 0 & 0 & 0 & 0 & 0 & 0 & 0 \\ & & & & & & \vdots & & & & & \\ 0 & 0 & 0 & 0 & 0 & 0 & 0 & 0 & 0 & 1 & 1 & 1 \\ 1 & 1 & 0 & 0 & 0 & 0 & 0 & 0 & 0 & 0 & 0 & 0 \\ & & & & & & \vdots & & & & & \\ 0 & 0 & 0 & 0 & 0 & 0 & 0 & 0 & 0 & 0 & 1 & 1 \end{bmatrix} \mathbf{I}_{12}$$

Temporal reconciliation

For a time series y_1, \dots, y_T , observed at frequency m :

$$x_j^{[k]} = \sum_{t=(j-1)k+1}^{jk} y_t \quad \text{for } j = 1, \dots, \lfloor T/k \rfloor$$

- $k \in \mathcal{K} = \{k_1, \dots, k_p\}$ denote the p factors of m in ascending order, where $k_1 = 1$ and $k_p = m$
- $x_j^{[1]} = y_t$
- A single unique hierarchy is only possible when there are no coprime pairs in \mathcal{K} .
- $M_k = m/k$ is seasonal period of aggregated series.

Temporal reconciliation

$$\mathbf{x}_\tau = \mathbf{S} \mathbf{x}_\tau^{[1]}, \quad \mathbf{S} = \begin{bmatrix} \mathbf{A} \\ \mathbf{I} \end{bmatrix}$$

where

$$\mathbf{x}_\tau = \begin{bmatrix} \mathbf{x}_\tau^{[k_p]} \\ \mathbf{x}_\tau^{[k_{p-1}]} \\ \vdots \\ \mathbf{x}_\tau^{[k_1]} \end{bmatrix}, \quad \mathbf{x}_\tau^{[k]} = \begin{bmatrix} \mathbf{x}_{M_k(\tau-1)+1}^{[k]} \\ \mathbf{x}_{M_k(\tau-1)+2}^{[k]} \\ \vdots \\ \mathbf{x}_{M_k\tau}^{[k]} \end{bmatrix}, \quad \mathbf{A} = \begin{bmatrix} \mathbf{1}'_m \\ \mathbf{I}_{m/k_{p-1}} \otimes \mathbf{1}'_{k_{p-1}} \\ \vdots \\ \mathbf{I}_{m/k_2} \otimes \mathbf{1}'_{k_2} \end{bmatrix}$$

τ is time index for most aggregated series,

$$k \in \mathcal{K} = \{k_1, \dots, k_p\}, \quad k_1 = 1, \quad k_p = m, \quad \tau = 1, \dots, T/m.$$

Temporal reconciliation: thief package

Outline

- 1 Temporal reconciliation
- 2 Temporal reconciliation: thief package
- 3 Temporal reconciliation: Examples
- 4 Cross-temporal forecast reconciliation
- 5 Cross-temporal probabilistic forecast reconciliation
- 6 Cross-temporal probabilistic reconciliation: Examples

Temporal reconciliation: M3 monthly series

- Apply temporal reconciliation to all 1428 monthly series from M3 competition
- Forecast horizon $h = 18$ months
- ETS and ARIMA models
- Measure percentage difference to base forecasts
- Reconciliation methods:
 - ▶ WLS_H (diagonal)
 - ▶ WLS_V (diagonal with common variances for same frequency)
 - ▶ WLS_S (diagonal/structural)

Temporal reconciliation: M3 monthly series

Aggregation		ETS				ARIMA

Type 1 Departments – Major A&E > 2 hours

Type 2 Departments – Single Specialty > 2 hours

Type 3 Departments – Other A&E/Minor Injury Unit > 2 hours

Total Attendances > 2 hours

Emergency Admissions via Type 1 A&E

Total Emergency Admissions via A&E

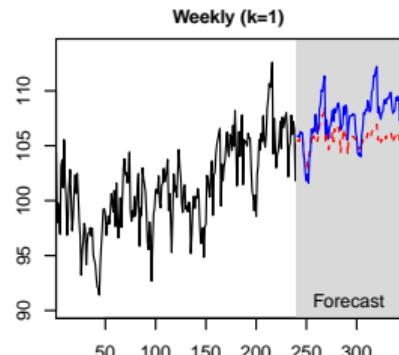

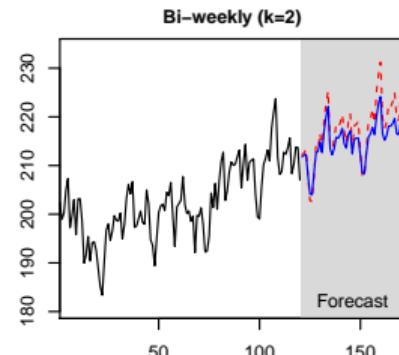

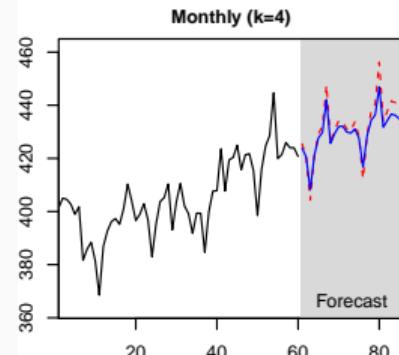

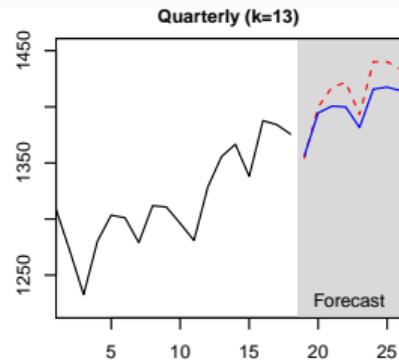

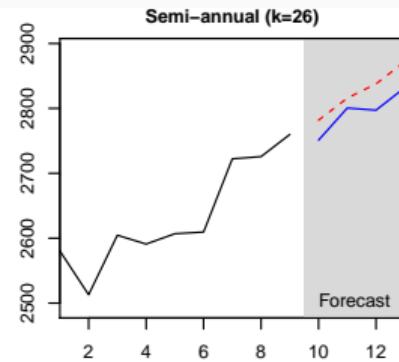

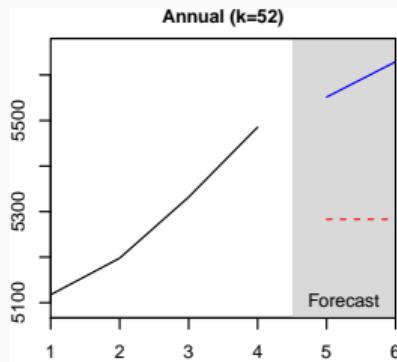

Other Emergency Admissions (i.e not via A&E)

Total Emergency Admissions

Number of patients spending > 2 hours from decision to admit to admission

Example: Accident & emergency services demand

Total emergency admissions via A&E

Example: Accident & emergency services demand

Test set: last 52 weeks

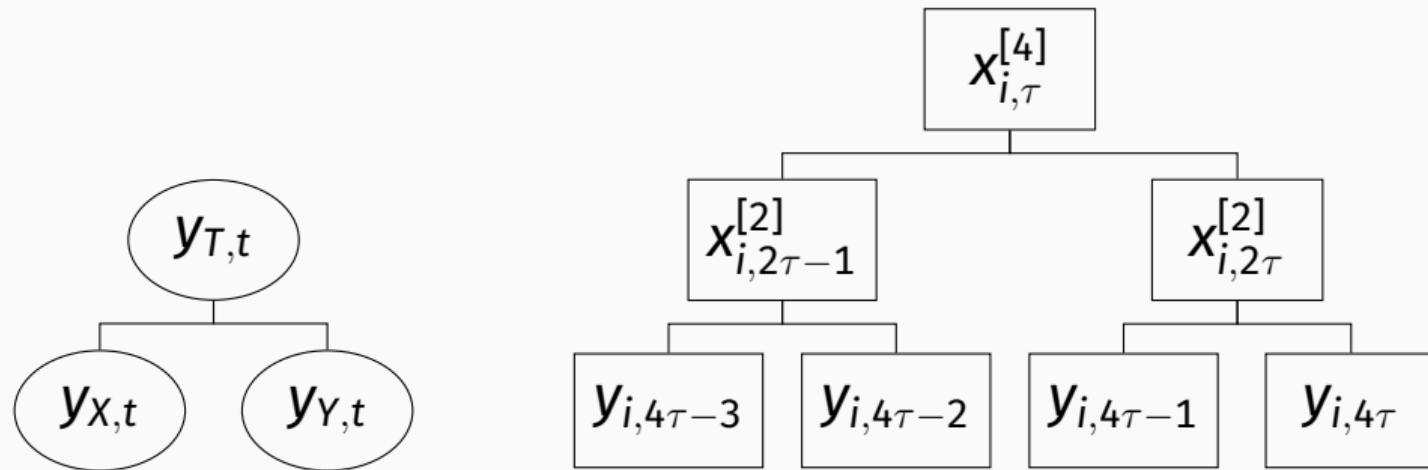

MASE comparison (ARIMA models)

Aggr. Level	h	Base	Reconciled	Change
Annual	1	3.4	1.9	-42.9%
Weekly	1–52	2.0	1.9	-5.0%
Weekly	13	2.3	1.9	-16.2%
Weekly	4	1.9	1.5	-18.6%
Weekly	1	1.6	1.3	-17.2%

Outline

- 1 Temporal reconciliation
- 2 Temporal reconciliation: thief package
- 3 Temporal reconciliation: Examples
- 4 Cross-temporal forecast reconciliation
- 5 Cross-temporal probabilistic forecast reconciliation
- 6 Cross-temporal probabilistic reconciliation: Examples

Cross-temporal forecast reconciliation

- $n = 3, n_a = 1, n_b = 2$
- Quarterly series: $m = 2, \mathcal{K} = \{1, 2, 4\}$

Cross-temporal forecast reconciliation

- \mathbf{y}_t = series at most temporally disaggregated level, including all cross-sectionally disaggregated and aggregated series.
- $y_{i,t}$ = i th element of \mathbf{y}_t , $i = 1, \dots, n$.
- For each i , we can expand $y_{i,t}$ to include all temporally aggregated variants:

$$\mathbf{x}_{i,\tau} = \begin{bmatrix} \mathbf{x}_{i,\tau}^{[k_p]} \\ \vdots \\ \mathbf{x}_{i,\tau}^{[k_1]} \end{bmatrix} \quad \mathbf{x}_\tau = \begin{bmatrix} \mathbf{x}_{1,\tau} \\ \vdots \\ \mathbf{x}_{n,\tau} \end{bmatrix}.$$

Cross-temporal forecast reconciliation

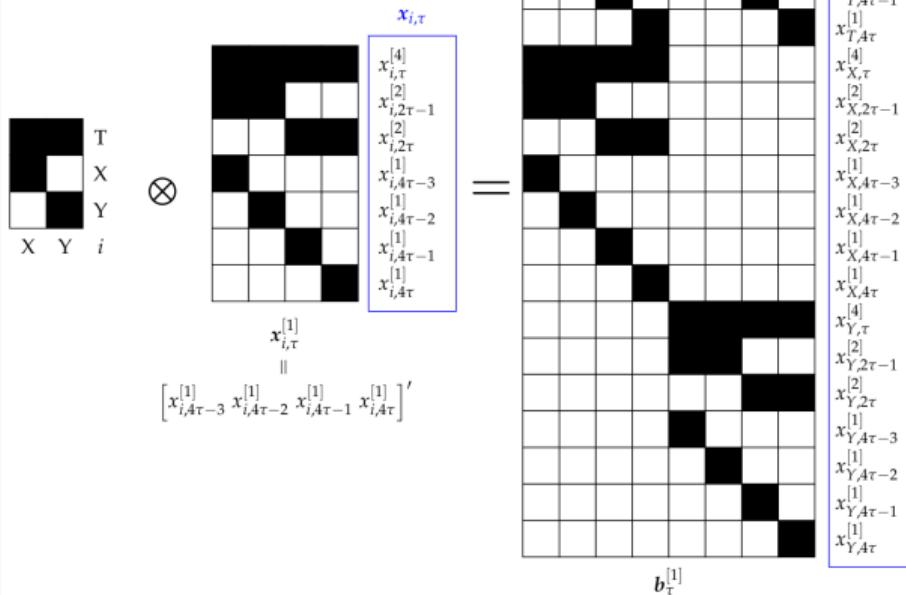

Structural matrix approach

- \mathbf{S}_{cs} = structural cross-sectional matrix
- \mathbf{S}_{te} = structural temporal matrix
- $\mathbf{S}_{ct} = \mathbf{S}_{cs} \otimes \mathbf{S}_{te}$

$$\mathbf{x}_\tau = \mathbf{S}_{ct} \mathbf{b}_\tau, \quad \text{where} \quad \mathbf{b}_\tau = \begin{bmatrix} \mathbf{x}_{1,\tau}^{[1]} \\ \vdots \\ \mathbf{x}_{n,\tau}^{[1]} \end{bmatrix}.$$

Cross-temporal forecast reconciliation

$$\mathbf{S}_{cs} \otimes \mathbf{S}_{te} = \mathbf{S}_{ct}$$

Cross-temporal forecast reconciliation

Constraint matrix approach

- \mathbf{C}_{cs} = cross-sectional constraint matrix
- \mathbf{C}_{te} = temporal constraint matrix

$$\mathbf{C}_{ct}\mathbf{x}_\tau = \mathbf{0} \quad \text{where} \quad \mathbf{C}_{ct} = \begin{bmatrix} (\mathbf{0}_{(n_a m \times nk^*)} \ I_m \otimes \mathbf{C}_{cs}) \mathbf{P}' \\ \ I_n \otimes \mathbf{C}_{te} \end{bmatrix}$$

- $k^* = \sum_{k \in \mathcal{K} \setminus \{k_1\}} \frac{m}{k}$
- \mathbf{P} = the commutation matrix such that $\mathbf{P}\text{vec}(\mathbf{Y}_\tau) = \text{vec}(\mathbf{Y}'_\tau)$.

Outline

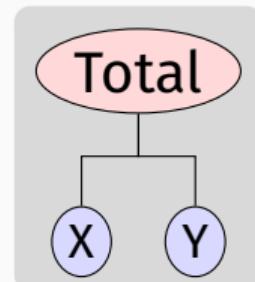

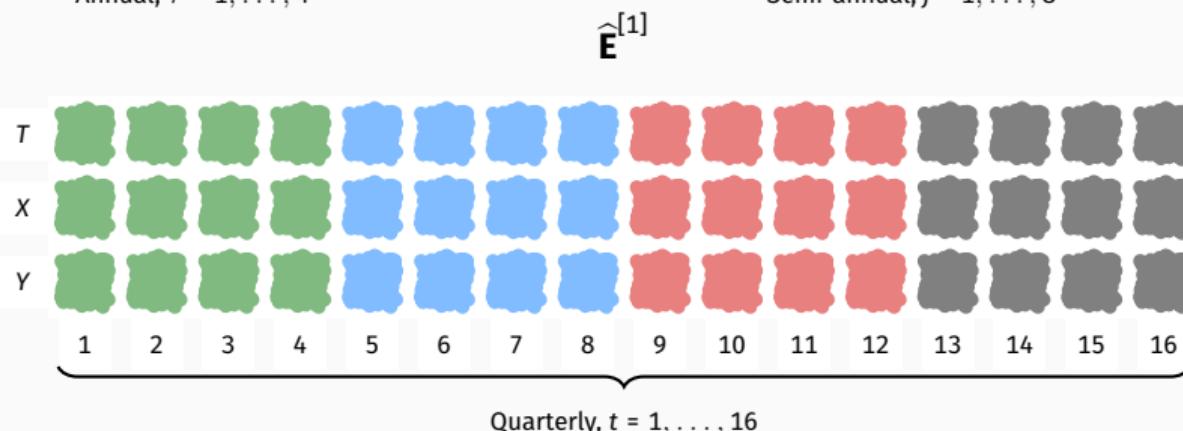

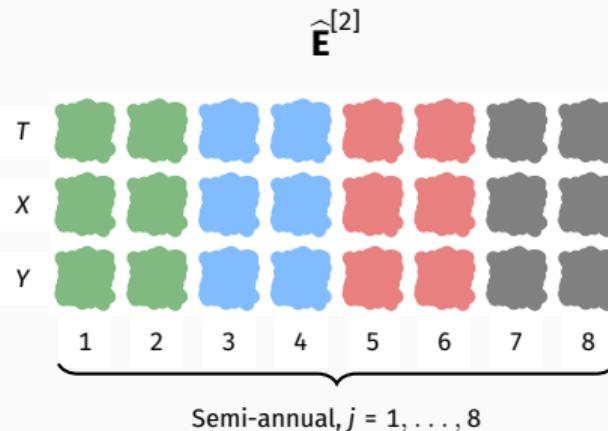

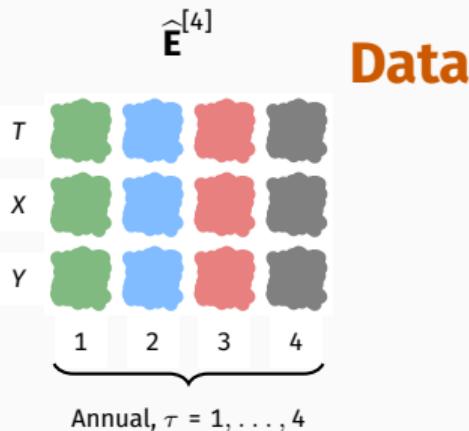

- 1 Temporal reconciliation
- 2 Temporal reconciliation: thief package
- 3 Temporal reconciliation: Examples
- 4 Cross-temporal forecast reconciliation
- 5 Cross-temporal probabilistic forecast reconciliation
- 6 Cross-temporal probabilistic reconciliation: Examples

Cross-temporal probabilistic forecast reconciliation

Nonparametric bootstrap

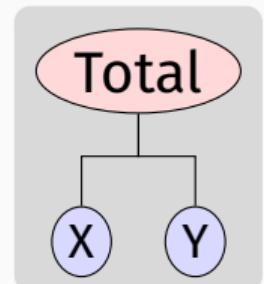

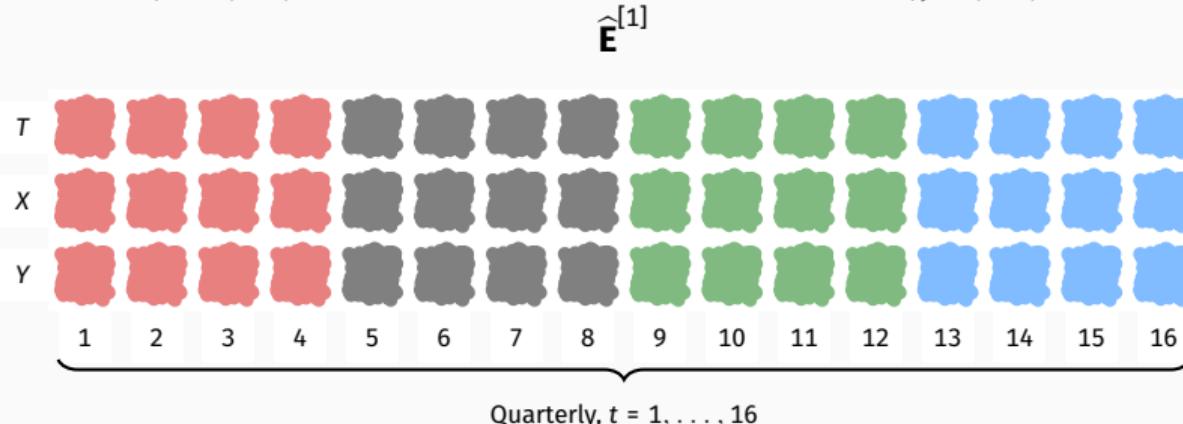

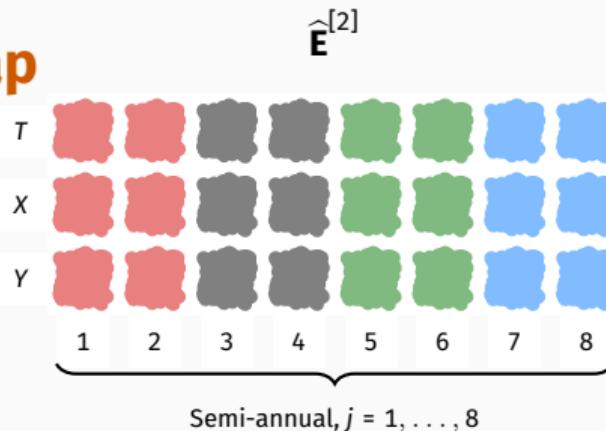

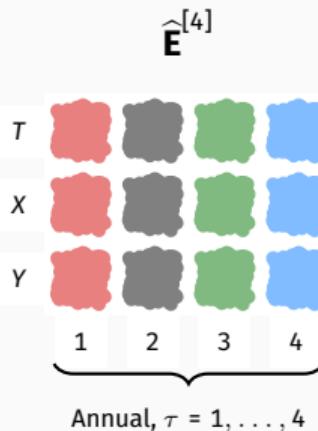

- Simulate future sample paths from all models using bootstrapped residuals, then reconcile them to obtain coherent sample paths.
- Need to generate samples that preserve cross-temporal relationships.
- Draw residual samples of all series at same time from most temporally aggregated level.
- Residuals for other levels obtained using the corresponding time indices.

Quarterly Australian GDP data

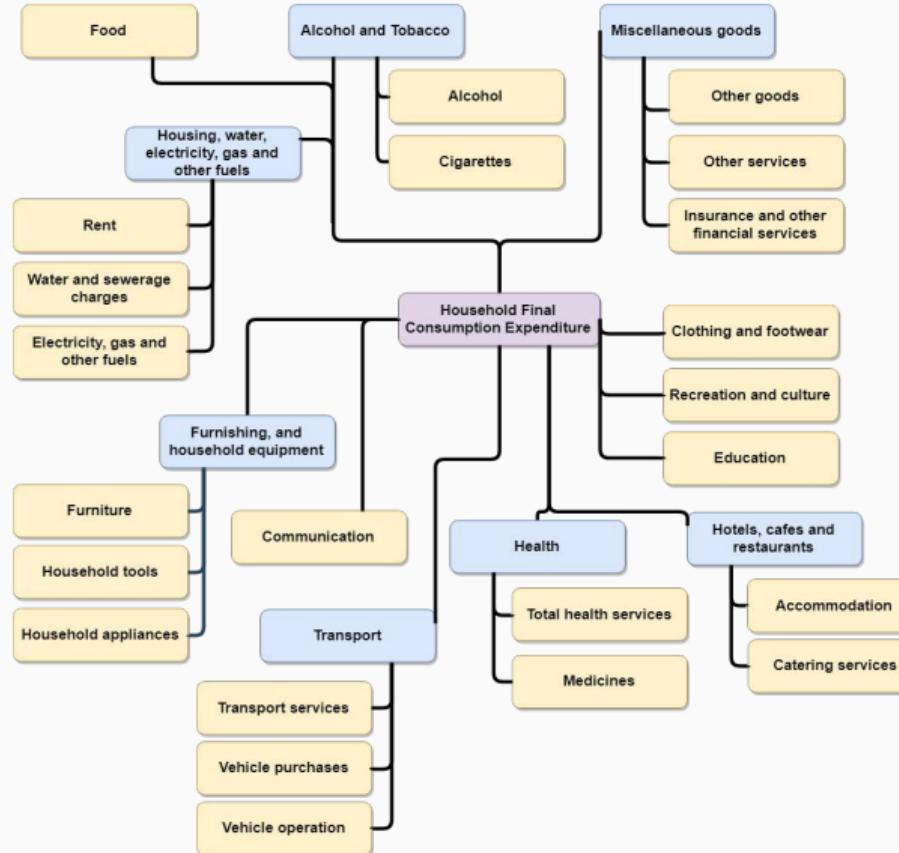

Quarterly Australian GDP data

Quarterly Australian GDP data

Quarterly Australian GDP data

Quarterly Australian GDP data

- Quarterly data: 1984:Q4 – 2018:Q1
- 95 series
- Time series cross-validation; initial training set of 10 years.
- One-quarter increase in each training set
- For each training set, compute temporally aggregated series for $k \in \{1, 2, 4\}$, and produce forecasts up to $h_1 = 4$, $h_2 = 2$, and $h_4 = 1$ steps ahead.
- Automatic ARIMA forecasts for all series.

Quarterly Australian GDP data – CRPS skill scores

Reconciliation approaches

- Cross-temporal **bottom-up** and **partly bottom-up**

$ct(shr_{cs}, bu_{te}) \quad | \quad ct(wlsv_{te}, bu_{cs}) \quad |$

- Optimal forecast reconciliation with **overlapping one-step residuals**

$oct_o(wlsv) \quad | \quad oct_o(bdshr) \quad |$

- Optimal forecast reconciliation with **overlapping and multi-step residuals**

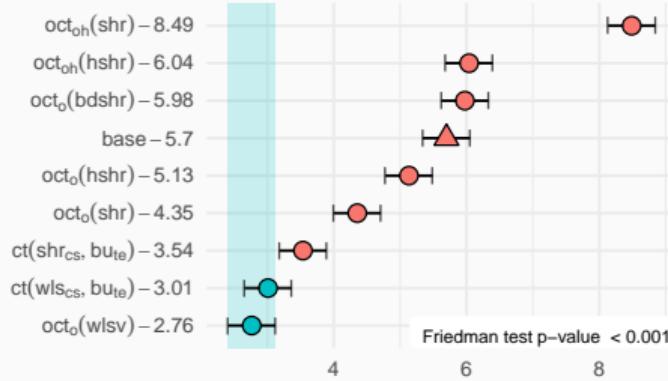

$oct_{oh}(hshr) \quad | \quad oct_{oh}(shr) \quad |$

Quarterly Australian GDP data – CRPS skill scores

	Worse than benchmark	Best			
Reconciliation approach	$\forall k \in \{4, 2, 1\}$		$k = 1$	$k = 2$	$k = 4$
base		1.000	1.000	1.000	1.000
$ct(shr_{cs}, bu_{te})$		0.937	0.992	0.949	0.874
$ct(wls_{cs}, bu_{te})$		0.930	0.986	0.942	0.866
$oct_o(wlsv)$		0.926	0.984	0.938	0.860
$oct_o(bdshr)$		0.978	1.034	0.991	0.914
$oct_{oh}(shr)$		1.102	1.172	1.120	1.020
$oct_{oh}(hshr)$		1.006	1.068	1.021	0.934

Quarterly Australian GDP data: Nemenyi test

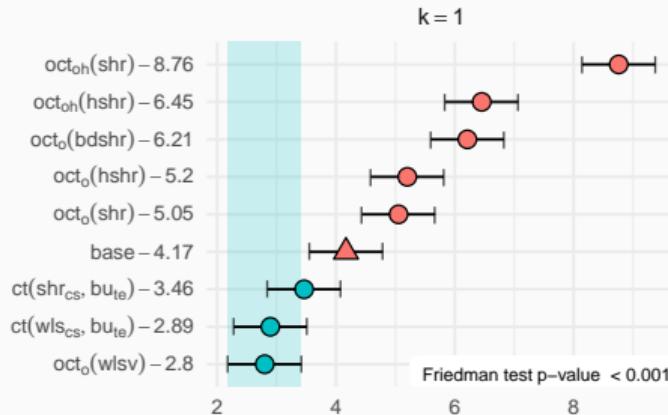

$k \in \{4, 2, 1\}$

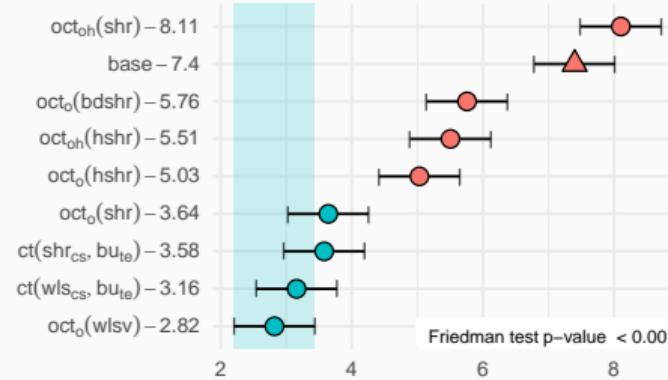

$k = 2$

$k = 1$

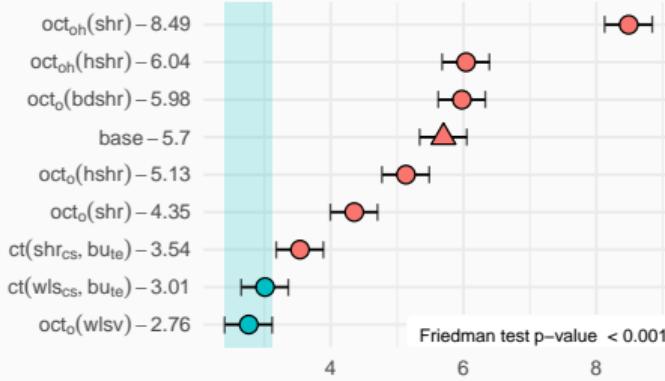

$k = 4$

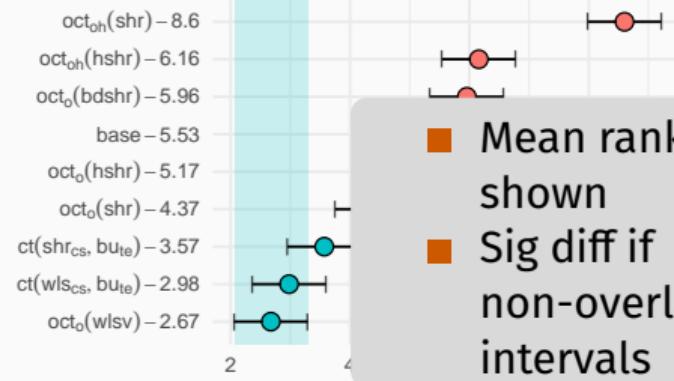

Quarterly Australian GDP data: Nemenyi test

$$k \in \{4, 2, 1\}$$

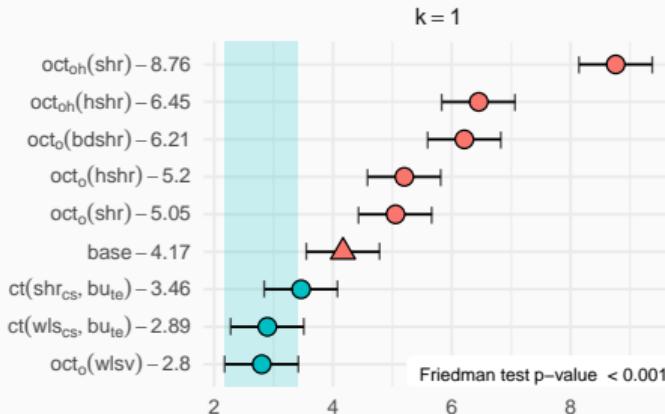

$$k = 2$$

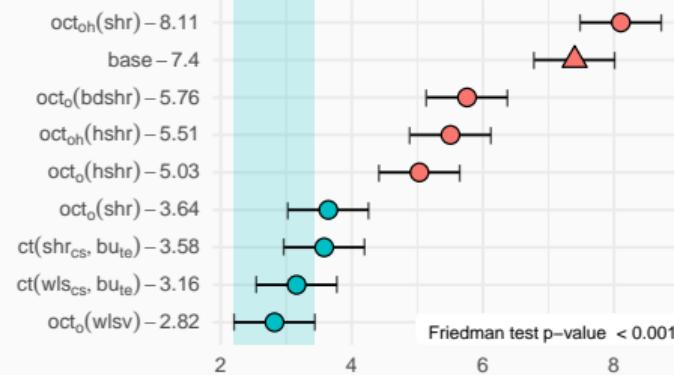

- Mean ranks shown
- Sig diff if non-overlapping intervals

$$k = 1$$

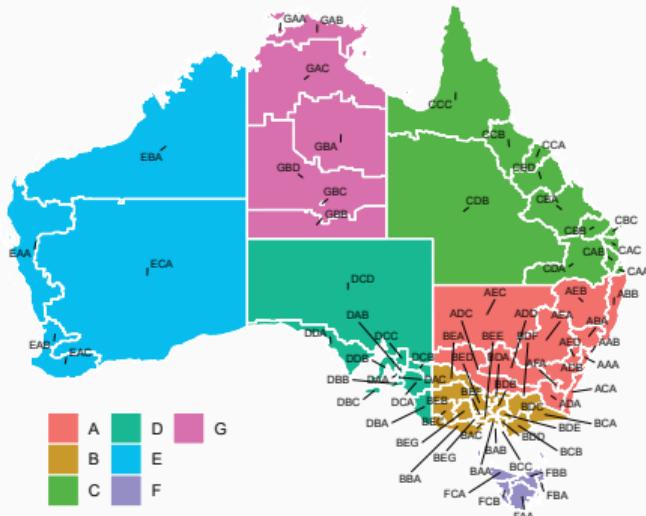

$$k = 4$$

Monthly Australian Tourism Demand

Geographical division

x

Purpose of travel

Holiday, Visiting friends & relatives, Business, Other

■ Grouped ts

(geographical divisions \times purpose of travel)

	AUS	States	Zones*	Regions	Tot
g.d.	1	7	21	76	105
p.o.t.	4	28	84	304	420
Tot	5	35	105	380	525

$$n_a = 221, n_b = 304, \text{ and } n = 525$$

■ Temporal framework, frequencies:

- ▶ Monthly
 - ▶ Bi-Monthly
 - ▶ Quarterly
 - ▶ Four-Monthly
 - ▶ Semi-Annual
 - ▶ Annual

Example: Monthly Australian Tourism Demand

- Monthly data: January 1998 to December 2016
- Time series cross-validation; initial training set 10 years.
- One-month increase in each training set
- For each training set, compute temporally aggregated series for $k \in \{1, 2, 3, 4, 6, 12\}$, and produce forecasts up to $h_2 = 6$, $h_3 = 4$, $h_4 = 3$, $h_6 = 2$ and $h_{12} = 1$ steps ahead.
- Automatic ETS forecasts on log-transformed data

Example: Australian GDP data – CRPS skill scores

Reconciliation approaches

- Cross-temporal **bottom-up** and **partly bottom-up**

$ct(bu)$ | $ct(shr_{cs}, bu_{te})$ | $ct(wlsv_{te}, bu_{cs})$

- Optimal forecast reconciliation with **one-step residuals**

$oct(ols)$ | $oct(struc)$ | $oct(wlsv)$ | $oct(bdshr)$

- Optimal forecast reconciliation with **multi-step residuals**

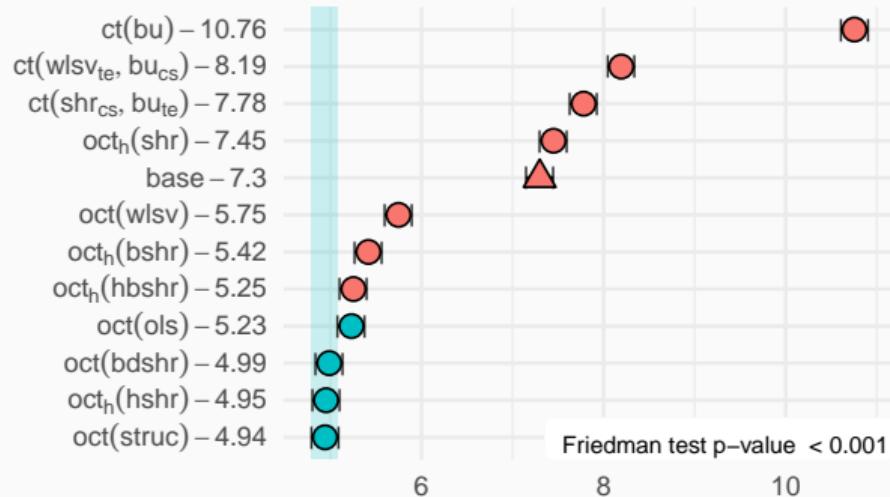

$oct_h(hbshr)$ | $oct_h(bshr)$ | $oct_h(hshr)$ | $oct_h(shr)$

Example: Australian tourism data – CRPS skill scores

	Worse than benchmark	Best
	$\forall k \in \{12, 6, 4, 3, 2, 1\}$	$k = 1$
base	1.000	1.000
ct(bu)	1.321	1.077
ct(shr _{cs} , bu _{te})	1.057	0.976
ct(wlsv _{te} , bu _{cs})	1.062	0.976
oct(ols)	0.989	0.982
oct(struc)	0.982	0.970
oct(wlsv)	0.987	0.952
oct(bdshr)	0.975	0.949
oct _h (hbshr)	0.989	0.982
oct _h (bshr)	0.994	0.988
oct _h (hshr)	0.969	0.953
oct _h (shr)	1.007	1.000

MCB Nemenyi test

$$k \in \{12, 6, 4, 3, 2, 1\}$$

$$k = 1$$

- mean ranks shown
- significant differences if non-overlapping intervals

Thanks!
